WEB DEVELOPMENT PROJECT REPORT

TravelGo – Bus and Train Booking Website

1. Introduction

TravelGo is a simple website designed to show how people could search for bus and train journeys in one place. I created different sections so users can move around the page and see sample travel services, a passenger form, a seat layout and fare details.

2. Technologies Used

The website is made using HTML and CSS. HTML is used for the page structure, navigation links, forms, service cards and fare table. CSS is used to style the page with colours, spacing, buttons, card layouts and hover effects. The HTML file connects to a separate stylesheet named style.css.

3. Main Features

- Navigation links for Home, Book Tickets, Buses, Trains, Select Seats and Contact.
- A journey search form for source, destination, date, travel type and number of passengers.
- Sample bus and train service details with example fares.
- A passenger details form with name, age, gender, email and phone fields.
- A visual seat layout showing available and booked seats.
- A fare table comparing sample bus and train ticket prices.

4. Design

The page uses a dark header and navigation bar, a coloured welcome section, and separate content sections to make the information easier to follow. Cards are used for the bus and train details, while the table keeps the fare information organised.

5. Limitations

This is a front-end demonstration, not a working ticket-booking service. The services and prices are examples. The seat layout is only a visual display, and the forms do not connect to a database or complete real bookings or payments.

6. Conclusion

Through this project, I practised using HTML to organise webpage content and CSS to improve its appearance. I also learned how forms, navigation links, cards and tables can be used in a website. In the future, JavaScript and a back-end system could be added to make the booking process functional.
