WEB DEVELOPMENT PROJECT REPORT

Campus Cravings – Fast Campus Delivery Website

1. Introduction

Campus Cravings is a simple food-ordering website designed for college students. The idea is to make it easy for students to view a small menu, check prices and enter their details for delivery to a hostel or another campus location. The page is built as a front-end web development project using HTML and CSS.

2. Technologies Used

HTML: HTML is used to organise the website content, including the navigation bar, menu cards, order form and contact section. The form contains fields for the customer's name, phone number, delivery address, food choice, quantity and payment method.

CSS: CSS controls the appearance of the page. It sets the colours, spacing, text sizes, menu-card layout, form styling and hover effects. The stylesheet also includes a small-screen layout adjustment so the header and form are easier to use on mobile devices.

3. Main Features

- Navigation bar: Links to the Home, Menu, Order and Contact sections.
- Welcome section: Introduces the service and includes a button that takes users to the menu.
- Food menu: Shows six sample items with short descriptions and prices, including a veg burger, paneer roll, pizza, fries, cold coffee and fried rice.
- Order form: Collects basic delivery information and lets the user choose an item, quantity and payment method.
- Contact section: Displays sample contact information in the footer.

4. Design and Layout

The website uses an orange, white and dark-grey colour scheme. Orange is used for the logo, prices and important buttons, helping them stand out from the rest of the page. The menu is arranged in separate cards, while the order form is placed in its own section to keep the page organised. Hover effects give buttons and links a simple response when the pointer moves over them.

5. Limitations

At this stage, Campus Cravings is a front-end demonstration rather than a complete food delivery system. The order form does not send orders to a server or save them in a database, and the payment options are displayed for demonstration only. A working version would need JavaScript and/or a back-end service to process orders and confirm delivery details.

6. Conclusion

This project helped me practise using HTML to structure a web page and CSS to make it clear and presentable. It also gave me experience with navigation links, forms, card layouts, buttons and responsive styling. The website can be improved in the future by adding order confirmation, a real menu database and a secure payment process.
